(54) Title: EQUIPMENT FOR CONTROLLING BLOOD FLOW IN AN EXTRACORPOREAL BLOOD CIRCUIT

(57) Abstract: Equipment for controlling blood flow in an extra-
corporeal blood circuit, comprising at least a first sensor (11),
designed to measure an arterial pressure (Part) upstream of a peristaltic
pump (9); at least a second sensor (12), designed to measure an
angular velocity (Ω) of the peristaltic pump; a memory (14) de-
signed to store at least one set value (Q_{set}) of the desired blood
flow through the access branch, and a calibration function (F) in
at least the variables ($v1$), related to the angular velocity (Ω) of the
pump, ($v2$), related to the arterial pressure (Part) in the portion of
the said access branch upstream of the peristaltic pump, ($v3$), re-
lated to an actual flow of blood (Q_{actual}) through the said access
branch; and at least one control unit (13), capable of calculating an
actual flow value (Q_{actual}) by applying the function F to the values
of angular velocity and arterial pressure (Part, Ω) measured by the
sensors; comparing the actual flow (Q_{actual}) with the desired flow
(Q_{set}); and varying the angular velocity of the said peristaltic pump
if the $Q_{actual} - Q_{set}$ lies outside a predetermined range.
